**Array Homework**

1. Create a Document that displays information about cars. First, create a select with an id="make". It will not have any makes in the options until the page finishing loading. When the page is loaded, have at least 5 manufacturer names you like in that list.

   When the user selects a make, you will take their selection and create a new select element with an id="model". Populate another select box with all the models of that make.

   When the user selects a model, you will display all the information you have coded in your models array. You can use multi-dimensional arrays if you want, or you may just have several array defined for each model.

   Have a button that resets the page back to its start (no select boxes but the first one: makes).

   ## Welcome to the car detail service.

   Once you choose from the list of manufacturers below,
   you will then see a list of models.

   Once you have made that final selection, you will see all
   the information we have about your selected make and model.

   [Select One ▲▼]

   ## You have selected to view all the models we know about regarding: [selection]

   [Select One ▲▼]

   ## Here is are the details:

   Ford Mustang

   cylinders: 4(base) 6(gt)
   mpg: 19(city) 25(highway)
   passengers: 5
   airbags: front, side and driver

   [Restart]

   Multi-dimensional arrays are just arrays within arrays. Please research and explore them. If you are adventurous enough and want to know more about their value, please use w3schools.com and/or your favorite search engine.
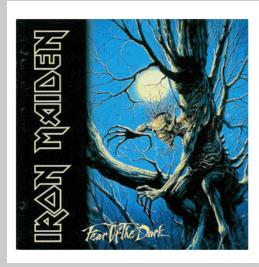

2. Create a Document that show information about albums.

   First create a paragraph or two about the purpose of the page and your interests in music: genres, styles, etc.

   Next have a select element with an id="albums" As soon as the user selects an album title or name, you will display:
   - The name of the ablum

- When released
- A brief review of album
- An image of the album

Iron Maiden
1987

Their seminal work.
